Die oben unter Punkt 5, genannten Mischungen eignen sich bevorzugt zur Verwendung in Maiskulturen zur Bekämpfung von *Digitaria* spp.; *Echinochloa* spp.; *Eriochloa villosa*; *Panicum* spp.; *Setaria faberi*; *Sorghum bicolor*; *Sorghum hal.* (S); *Abutilon theoph.*; *Ambrosia* spp.; *Amaranthus retr.*; *Bidens* spp.; *Chenopodium* spp.; *Datura stram.*; *Euphorbia* het.; *Ipomea* spp.; *Polygonum* spp.; *Sida* spp.; *Xanthium* spp.; *Cyperus exculent.*; und *Elymus repens*.

Die Aufwandmenge kann innerhalb weiterer Bereiche variieren und hängt von der Beschaffenheit des Bodens, der Art der Anwendung (pre- oder postemergent; Saatbeizung; Anwendung in der Saatzfurche; no tillage Anwendung etc.), der Kulturpflanze, dem zu bekämpfenden Unkraut, den jeweils vorherrschenden klimatischen Verhältnissen und anderen durch Anwendungsart, Anwendungszeitpunkt und Zielkultur bestimmten Faktoren ab.

Die Gemische der Verbindung der Formel I mit den Verbindungen der Formeln II, können in unveränderter Form, d. h. wie sie in der Synthese anfallen, eingesetzt werden. Vorzugsweise verarbeitet man sie aber auf übliche Weise mit den in der Formulierungstechnik gebräuchlichen Hilfsmitteln, wie Lösungsmittel, feste Träger oder Tenside, z. B. zu emulgierbaren Konzentraten, direkt versprühbaren oder verdünnbaren Lösungen, verdünnten Emulsionen, Spritzpulvern, löslichen Pulvern, Stäubemitteln, Granulaten oder Mikrokapseln. Die Anwendungsverfahren wie Versprühen, Vernebeln, Verstäuben, Benetzen, Verstreuen oder Gießen werden, gleich wie die Art der Mittel, den angestrebten Zielen und den gegebenen Verhältnissen entsprechend gewählt.

Die Formulierungen sowie gegebenenfalls ein oder mehrere feste oder flüssige Formulierungshilfsmittel enthaltenden Mittel, Zubereitungen oder Zusammensetzungen werden in an sich bekannter Weise hergestellt, z. B. durch inniges Vermischen und/oder Vermahlen der Wirkstoffe mit den Formulierungshilfsmitteln wie z. B. Lösungsmittel oder festen Trägerstoffe. Ferner können zusätzlich oberflächenaktive Verbindungen (Tenside) bei der Herstellung der Formulierungen verwendet werden.

Beispiele für Lösungsmittel und feste Trägerstoffe sind z. B. in der WO 97/34485 Seite 6 angegeben.

Als oberflächenaktive Verbindungen kommen je nach der Art des zu formulierenden Wirkstoffes der Formel I nichtionogene, kation- und/oder anionaktive Tenside und Tensidgemische mit guten Emulgier-, Dispergier- und Netz Eigenschaften in Betracht.

Beispiele für geeignete anionische, nichtionische und kationische Tenside sind beispielsweise in der WO 97/34485, Seiten 7 und 8 aufgezählt.

Ferner sind auch die in der Formulierungstechnik gebräuchlichen Tenside, die u. a. in "Mc Cutcheon's Detergents and Emulsifiers Annual" MC Publishing Corp., Ridgewood New Jersey, 1981, Stache, H., "Tensid-Taschenbuch", Carl Hanser Verlag, München/Wien, 1981 und M. und J. Ash, "Encyclopedia of Surfactants", Vol. I-III, Chemical Publishing Co., New York, 1980-81 beschrieben sind, zur Herstellung der erfindungsgemäßen herbiziden Mittel geeignet.

Die herbiziden Formulierungen enthalten in der Regel 0,1 bis 99 Gew.-%, insbesondere 0,1 bis 95 Gew.-% Wirkstoffgemisch 1 bis 99,9 Gew.-% eines festen oder flüssigen Formulierungshilfsmittels und 0 bis 25 Gew.-%, insbesondere 0,1 bis 25 Gew.-% eines Tensides.

Während als Handelsware üblicherweise konzentrierte Mittel bevorzugt werden, verwendet der Endverbraucher in der Regel verdünnte Mittel. Die Mittel können auch weitere Zusätze wie Stabilisatoren z. B. gegebenenfalls epoxydierte Pflanzenöle (epoxydiertes Kokosnußöl, Rapsöl oder Sojaöl), Entschäumer, z. B. Silikonöl, Konservierungsmittel, Viskositätsregulatoren, Bindemittel, Haftmittel sowie Dünger oder andere Wirkstoffe enthalten. Insbesondere setzen sich be-

F8. Suspensions-Konzentrate

| | a) | b) | c) | d) |
|--|-------|-------|-------|-------|
| Wirkstoffgemisch | 3 % | 10 % | 25 % | 50 % |

| Silikonöl-Emulsion | 0.8 % | 0.8 % | 0.8 % | 0.8 % |
| Wasser | 87 % | 79 % | 62 % | 38 % |

Der feingemahlene Wirkstoff wird mit den Zusatzstoffen innig vermisch. Man erhält so ein Suspensions-Konzentrat, aus welchem durch Verdünnen mit Wasser Suspensionen jeder gewünschten Konzentration hergestellt werden können.

Es ist oft praktischer, die Wirkstoffe einzeln zu formulieren und sie dann kurz vor dem Ausbringen im Applikator im gewünschten Mischungsverhältnis als "Tankmischung" im Wasser zusammenzubringen.

Beispiel B1: Pre-emergenter Versuch

Die Versuchspflanzen werden unter Gewächshausbedingungen in Töpfen angesät. Als Kultursubstrat wird eine Standarderde verwendet. In einem Voraufstadium werden die Herbizide sowohl allein als auch in Mischung auf die Bodenoberfläche appliziert. Die Aufwandmengen richten sich nach den unter Feld- oder Gewächshausbedingungen ermittelten optimalen Dosierungen. Die Auswertung der Versuche erfolgt nach 2 bis 4 Wochen (100% Wirkung = vollständig abgestorben; 0% Wirkung = keine phytotoxische Wirkung). Die in diesem Versuch verwendeten Mischungen zeigen gute Resultate.

Beispiel B2: Post-emergenter Versuch

Die Versuchspflanzen werden unter Gewächshausbedingungen in Töpfen bis zu einem Postapplikationsstadium angezogen. Als Kultursubstrat wird eine Standarderde verwendet. In einem Nachaufstadium werden die Herbizide sowohl allein als auch in Mischung auf die Testpflanzen appliziert. Die Aufwandmengen richten sich nach den unter Feld- oder Gewächshausbedingungen ermittelten optimalen Dosierungen. Die Auswertung der Versuche erfolgt nach 2 bis 4 Wochen (100% Wirkung = vollständig abgestorben; 0% Wirkung = keine phytotoxische Wirkung). Auch in diesem Versuch zeigten die verwendeten Wirkstoff-Kombinationen gute Resultate.
